Figure	Description

Document Change Log

Issue	Revision	Date	Affected	Reason for change
1	1	March 2007	All	New document
1	2	July 2008	All	Added feature to develop telecommand procedures without graphical interface
1	3	August 2008	Chapter 3.1.	Added support for bandwidth measurement
1	4	May 2011	Chapter 3.1.	Added: ' GetPastValueTime ' function
1	5	January 2016	Chapter 3.3.	Added satellite tracking, pass & interlink functions

BINARY SPACE

RELIABLE SPACE SYSTEMS

1. Introduction

The **Telecommand Procedure Language** (TPL) is the programming language of SatView™ to implement telecommand procedures. It is a macro extension to the common C++ language. The associated library provides access to all kind of information related to the telemetry data and simplifies the decision if, when and how a telecommand should be released.

A telecommand procedure is usually developed in a graphical way through a *Telecommand Procedure Display* (TPD). This kind of display automatically generates the source code resulting from the thread related flowcharts and provides all features necessary to debug a telecommand procedure.

2. Syntax

The source code of a telecommand procedure always consists of a single major procedure hosting one or more thread blocks:

```
TELECOMMAND PROCEDURE 'Name' [ (argument-declaration-list) ]
[variable-declarations]
BEGIN
  { {THREAD 'Thread-Name'
    [TCPARAMETERS T1{, Ti};]
    [PARAMETERS P1{, Pi};]
  BEGIN
    TPL Code
  END } }
END
```

Comments:

The above notation is in *Extended Backus Naur Formalism* (EBNF).

Name	Name of the telecommand procedure		
Thread-Name	Name of a hosted thread		
<i>T</i> ₁ , ... <i>T</i> _i	Telecommand parameter identifiers		
<i>P</i> ₁ , ... <i>P</i> _i	Telemetry parameter identifiers	[x]:	x occurs once or never
<i>argument-declaration-list</i>	Formal argument list	{x}:	x occurs zero or more times
<i>variable-declarations</i>	Variable declarations	{{x}}:	x occurs at least once

BINARY SPACE

RELIABLE SPACE SYSTEMS

A telecommand procedure can have zero or more formal arguments. They must be declared with the **Arguments** property page. The same applies to the local variables; they are declared with the **Variables** property page. Any number of threads (but at least one) can be hosted by a telecommand procedure. Their definition takes place via the **Threads** property page. Debugging features are available through the **Debug** property page.

The source code of a telecommand procedure is usually generated automatically when using the available graphical interface. However, in certain situations, it might be of some advantage to slightly modify the automatically generated source code or to write it completely without the support of the graphical interface, a feature which is supported too.

The following guidelines have to be considered when writing or modifying the source code of a telecommand procedure:

Code	Description
<pre>THREAD '<i>Thread-Name</i>' [TCPARAMETERS <i>T₁</i>{,<i>T_i</i>};] [PARAMETERS <i>P₁</i>{,<i>P_i</i>};] BEGIN while (WaitThreadActivationExpression()) { // <i>Steps block code (TPL Code)</i> if (!IsThreadEnabled()) { ResetThread(); continue; } return TRUE; } END</pre>	<p>The source code of each thread consists of a loop waiting for the activation expression to get true first.</p> <p>Whenever a thread is going to terminate it should check if it is enabled. If yes, it can exit (by returning true), if no it should re-enter and wait again for the activation expression to become true.</p> <p>A thread that terminates due to a failure should always return false.</p> <p> Note: Do not change this part of the source code.</p>

In der Weid 3, CH-8122 Binz

Tel: +41 44 8877987, Fax: +41 44 8877989, Email: info@binary-space.com, Web: www.binary-space.com

BINARY SPACE

RELIABLE SPACE SYSTEMS

```
if (!CheckStepTrigger(TEXT("STEP_1")))
{ AlertStepTriggerFailure(TEXT("STEP_1"));
  return FALSE;
}
AlertStepTriggerSuccess(TEXT("STEP_1"));
if (!CheckStepBody(TEXT("STEP_1")))
{ AlertStepBodyFailure(TEXT("STEP_1"));
  return FALSE;
}

// Step body code (TPL Code)

AlertStepBodySuccess(TEXT("STEP_1"));
if (!CheckStepConfirmation(TEXT("STEP_1")))
{ AlertStepConfirmationFailure(TEXT("STEP_1"));
  return FALSE;
}
AlertStepConfirmationSuccess(TEXT("STEP_1"));
```

For each step inside a thread check the trigger first (use '**CheckStepTrigger**' and alert a failure if necessary with '**AlertStepTriggerFailure**'). If the trigger phase passed successfully this should also be notified (by '**AlertStepTriggerSuccess**'). Before the body phase of a step is started, its pre-execution expression should be checked (by using '**CheckStepBody**') and in case of a failure the appropriate notification should be done (with '**AlertStepBodyFailure**'). The same applies to the confirmation phase of a step (use '**CheckStepConfirmation**', '**AlertStepConfirmationSuccess**' or '**AlertStepConfirmationFailure**').

 Note:

Do not change or delete these step related functions as they are responsible for updating the flowcharts when the telecommand procedure is executing. Only the step body code should be modified.

In der Weid 3, CH-8122 Binz

BINARY SPACE

RELIABLE SPACE SYSTEMS

Without the graphical interface:

- Only simple data types (no classes or arrays) are allowed as arguments. Variables declared inside the [**variable-declarations**] section must also have a simple data type. Local variables of a thread however (as part of the TPL code) may be of any type.
- Full debugging support is available for variables declared inside the [**variable-declarations**] section only.
- Global subroutines are allowed and should be placed between the code for the various threads.

3. Library

Various library functions supported by the TPL provide easy access to the telemetry data characteristics. Together with the standard mathematical compiler libraries almost any calculation can be performed. The library is grouped into functions related to the action-object steps and others providing support in the area of telemetry data processing.

3.1. Telemetry Functions

The following functions are supported:

Function	Description
CString GetTMUnitTag (void)	Returns the identifier of the telemetry unit that is currently processed.  Note: When the Packet Telemetry Standard (CCSDS 102.0-B-2) is supported the function returns the name of the telemetry packet. For a telemetry format based standard, it results in a string with the syntax: 'FORMAT: n' where n is the frame number.
CTimeTag GetTMUnitTime (void)	Returns the time associated with the telemetry unit.  Note: The time identifies the moment when the telemetry unit was received on ground including eventual corrections to compensate any delays caused by the ground segment.

In der Weid 3, CH-8122 Binz

Tel: +41 44 8877987, Fax: +41 44 8877989, Email: info@binary-space.com, Web: www.binary-space.com

BINARY SPACE

RELIABLE SPACE SYSTEMS

<p>UINT GetTMUnitID(void)</p>	<p>Returns the number of the telemetry unit.</p> <p>☑ Note: When the Packet Telemetry Standard (CCSDS 102.0-B-2) is supported the function returns the <i>On Board Reference Time</i> (OBRT) of the telemetry packet. For a telemetry format based standard, it returns the number known as format counter.</p>
<p>BOOL GetTMUnitData(INT <i>nBytePos</i>, BYTE &<i>nValue</i>)</p>	<p>Returns the value of a byte at the specified location <i>nBytePos</i> (≥ 0) in the variable <i>nValue</i>.</p> <p>☑ Note: The function returns TRUE if the specified location is valid, FALSE otherwise.</p>
<p>BOOL GetTMUnitData(INT <i>nBytePos</i>, INT <i>nBitPos</i>,INT <i>nLength</i>, ULONGLONG &<i>nValue</i>)</p>	<p>Returns the value of data at the specified location <i>nBytePos</i> (≥ 0), <i>nBitPos</i> ($0 \leq nBitPos < 8$), <i>nLength</i> ($1 \leq nLength \leq 64$) in the variable <i>nValue</i>.</p> <p>☑ Note: The function returns TRUE if the specified location is valid, FALSE otherwise.</p>
<p>WORD GetTMUnitQuality(void)</p>	<p>Returns the data quality indication of the telemetry unit. It may be a combination of one or more of the following values:</p> <p>TMUNIT_DATAQUALITY_GOOD TMUNIT_DATAQUALITY_BAD TMUNIT_SEQUENCEQUALITY_GOOD TMUNIT_SEQUENCEQUALITY_BAD TMUNIT_TIMECORRELATION_GOOD TMUNIT_TIMECORRELATION_BAD</p> <p>☑ Note: The value TMUNIT_DATAQUALITY_NONE is returned in case of an error.</p>
<p>BOOL SetValue(<i>Parameter-Id</i>, INT <i>nOccurrence</i>,<i>type-specifier nValue</i>)</p>	<p>Sets the specified telecommand parameter <i>Parameter-Id</i> equal to the supplied (calibrated) value <i>nValue</i> at the occurrence <i>nOccurrence</i> (≥ 0).</p>

In der Weid 3, CH-8122 Binz

Tel: +41 44 8877987, Fax: +41 44 8877989, Email: info@binary-space.com, Web: www.binary-space.com

BINARY SPACE

RELIABLE SPACE SYSTEMS

<i>type-specifier</i> GetValue (<i>Parameter-Id</i>)	Returns the current (calibrated) value of telemetry/telecommand parameter <i>Parameter-Id</i> . ☑ Note: If the parameter occurs more than once within a telemetry/telecommand unit, the function returns the value of the first occurrence.
<i>type-specifier</i> GetValue (<i>Parameter-Id</i> , INT <i>nOccurrence</i>)	Returns the current (calibrated) value of telemetry/telecommand parameter <i>Parameter-Id</i> at the occurrence specified by <i>nOccurrence</i> (≥ 0). ☑ Note: If an illegal occurrence number is specified the functions return 0.
BOOL SetRawValue (<i>Parameter-Id</i> , INT <i>nOccurrence</i> , <i>type-specifier nValue</i>)	Sets the specified telecommand parameter <i>Parameter-Id</i> equal to the supplied raw value <i>nValue</i> at the occurrence <i>nOccurrence</i> (≥ 0).
<i>type-specifier</i> GetRawValue (<i>Parameter-Id</i>)	Returns the current raw value of telemetry/telecommand parameter <i>Parameter-Id</i> . ☑ Note: If the parameter occurs more than once within a telemetry/telecommand unit, the function returns the value of the first occurrence.
<i>type-specifier</i> GetRawValue (<i>Parameter-Id</i> , INT <i>nOccurrence</i>)	Returns the current raw value of telemetry/telecommand parameter <i>Parameter-Id</i> at the occurrence specified by <i>nOccurrence</i> (≥ 0). ☑ Note: If an illegal occurrence number is specified the functions return 0.
CTimeTag GetValueTime (<i>Parameter-Id</i>)	Returns the time associated with the current value of telemetry parameter <i>Parameter-Id</i> . ☑ Note: If the parameter occurs more than once within a telemetry unit, the function returns the value of the first occurrence.

BINARY SPACE

RELIABLE SPACE SYSTEMS

CTimeTag GetValueTime (<i>Parameter-Id</i> , INT <i>nOccurrence</i>)	Returns the time associated with the current value of telemetry parameter <i>Parameter-Id</i> at the occurrence specified by <i>nOccurrence</i> (≥ 0).  Note: If an illegal occurrence number is specified the functions return 0.
BOOL SetTimeValue (<i>Parameter-Id</i> , INT <i>nOccurrence</i> , CONST CTimeTag & <i>tTime</i>)	Sets the specified telecommand parameter <i>Parameter-Id</i> equal to the supplied time value <i>tTime</i> at the occurrence <i>nOccurrence</i> (≥ 0).
CTimeTag GetTimeValue (<i>Parameter-Id</i>)	Returns the current time value of telecommand parameter <i>Parameter-Id</i> .  Note: If the parameter occurs more than once within a telecommand unit, the function returns the value of the first occurrence.
CTimeTag GetTimeValue (<i>Parameter-Id</i> , INT <i>nOccurrence</i>)	Returns the current time value of telecommand parameter <i>Parameter-Id</i> at the occurrence specified by <i>nOccurrence</i> (≥ 0).  Note: If an illegal occurrence number is specified the functions return 0.
<i>type-specifier</i> GetPastValue (<i>Parameter-Id</i> , INT <i>nSample</i>)	Returns a past (calibrated) value of telemetry parameter <i>Parameter-Id</i> . The variable <i>nSample</i> specifies how many samples in the past the value should be from.  Note: If a parameter occurs more than once within a telemetry unit, each occurrence is counted as a sample.
<i>type-specifier</i> GetPastRawValue (<i>ParameterId</i> , INT <i>nSample</i>)	Returns a past raw value of telemetry parameter <i>Parameter-Id</i> . The variable <i>nSample</i> specifies how many samples in the past the value should be from.  Note: If a parameter occurs more than once within a telemetry unit, each occurrence is counted as a sample.

BINARY SPACE

RELIABLE SPACE SYSTEMS

<p>CTimeTag GetPastValueTime(<i>Parameter-Id</i>, INT <i>nSample</i>)</p>	<p>Returns the time associated with a past value of telemetry parameter <i>Parameter-Id</i>. The variable <i>nSample</i> specifies how many samples in the past the value should be from.</p> <p>☑ Note: If a parameter occurs more than once within a telemetry unit, each occurrence is counted as a sample.</p>
<p><i>type-specifier</i> CalculateValueAverage(<i>Parameter-Id</i>,INT <i>nSamples</i>)</p>	<p>Returns the raw average value of the last <i>nSamples</i> samples of telemetry parameter <i>Parameter-Id</i>.</p> <p>☑ Note: If less than <i>nSamples</i> samples have been collected, the function returns a floating average of the samples already encountered.</p>
<p>UINT GetStatus(<i>Parameter-Id</i>)</p>	<p>Returns the status of the telemetry/telecommand parameter <i>Parameter-Id</i> which may be a combination of the following values:</p> <p>TMPARAMETER_STATUS_GOOD TMPARAMETER_STATUS_BAD TMPARAMETER_STATUS_NOLIMIT TMPARAMETER_STATUS_SOFTLIMIT TMPARAMETER_STATUS_HARDLIMIT TMPARAMETER_STATUS_DELTALIMIT TMPARAMETER_STATUS_VALID TMPARAMETER_STATUS_INVALID</p> <p>☑ Note: The value TMPARAMETER_STATUS_NONE/TCPARAMETER_STATUS_NONE is returned if the telemetry/telecommand parameter has no value. Expect the following identifiers to be returned for telecommand parameters:</p> <p>TCPARAMETER_STATUS_NOLIMIT TCPARAMETER_STATUS_SOFTLIMIT TCPARAMETER_STATUS_HARDLIMIT TCPARAMETER_STATUS_DELTALIMIT</p>

In der Weid 3, CH-8122 Binz

BINARY SPACE

RELIABLE SPACE SYSTEMS

<p>UINT GetStatus(<i>Parameter-Id</i>, INT <i>nOccurrence</i>)</p>	<p>Returns the status of the telemetry/telecommand parameter <i>Parameter-Id</i> for the specified occurrence <i>nOccurrence</i>. See above for possible values returned by this function.</p> <p> Note: The value TMPARAMETER_STATUS_NONE/ TCPARAMETER_STATUS_NONE is returned if the telemetry/telecommand parameter has no value or an illegal occurrence number was specified. Expect the following identifiers to be returned for telecommand parameters: TCPARAMETER_STATUS_NOLIMIT TCPARAMETER_STATUS_SOFTLIMIT TCPARAMETER_STATUS_HARDLIMIT TCPARAMETER_STATUS_DELTALIMIT</p>
<p>double GetTotalTMBandwidth()</p>	<p>Returns the total amount of bits per second available for the telemetry data (including the protocol overhead for the telemetry unit).</p> <p> Note: A value of 'NAN' is returned when no bandwidth information is available. Use the macro isnans(double <i>f</i>) to check for that result.</p>
<p>double GetAvailableTMBandwidth()</p>	<p>Returns the currently unused bandwidth as a number between 0 and 1.</p> <p> Note: A value of 'NAN' is returned when no bandwidth information or measurement is available. Use the macro isnsn(double <i>f</i>) to check for that result.</p>
<p>double GetMaxDiagnosticTMBandwidth()</p>	<p>Returns the maximum of bits per second currently available for diagnostic purposes, dumps or reports.</p> <p> Note: A value of 'NAN' is returned when no bandwidth information is available. Use the macro isnans(double <i>f</i>) to check for that result.</p>

In der Weid 3, CH-8122 Binz

Tel: +41 44 8877987, Fax: +41 44 8877989, Email: info@binary-space.com, Web: www.binary-space.com

BINARY SPACE

RELIABLE SPACE SYSTEMS

double GetAvailableDiagnosticTMBandwidth()	Returns the bandwidth currently available for diagnostic purposes, dumps or reports as a number between 0 and 1. <input checked="" type="checkbox"/> Note: A value of 'NAN' is returned when no bandwidth information or measurement is available. Use the macro isnan(double f) to check for that result.
CTimeTag GetLastTMBandwidthMeasurementTime()	Returns the time of the last bandwidth measurement. <input checked="" type="checkbox"/> Note: A time equal to 0 is returned when no bandwidth information or measurement is available.

3.2. Action-object Step Functions

The following functions are supported:

3.2.1. Common Step Functions

Function	Description
BOOL CheckStepTrigger (LPCTSTR <i>pszStep</i>)	Checks the trigger condition of the specified step. <input checked="" type="checkbox"/> Note: This function returns TRUE if no trigger condition exists.
BOOL CheckStepBody (LPCTSTR <i>pszStep</i>)	Checks the pre-execution expression (if any) of the specified step. <input checked="" type="checkbox"/> Note: This function returns TRUE if no pre-execution expression exists.
BOOL CheckStepConfirmation (LPCTSTR <i>pszStep</i>)	Checks the confirmation condition of the specified step. <input checked="" type="checkbox"/> Note: This function returns TRUE if no confirmation condition exists.
VOID AlertStepTriggerSuccess (LPCTSTR <i>pszStep</i> , LPCTSTR <i>pszMessage</i> =NULL)	Notifies a successful trigger phase of the specified step and supplies an optional message.
VOID AlertStepTriggerWarning (LPCTSTR <i>pszStep</i> , LPCTSTR <i>pszMessage</i> =NULL)	Alerts a problematic trigger phase of the specified step and supplies an optional message.

BINARY SPACE

RELIABLE SPACE SYSTEMS

VOID AlertStepTriggerFailure (LPCTSTR <i>pszStep</i> , LPCTSTR <i>pszMessage</i> =NULL)	Alerts a failed trigger phase of the specified step and supplies an optional message.
VOID AlertStepBodySuccess (LPCTSTR <i>pszStep</i> , LPCTSTR <i>pszMessage</i> =NULL)	Notifies a successful body phase of the specified step and supplies an optional message.
VOID AlertStepBodyWarning (LPCTSTR <i>pszStep</i> , LPCTSTR <i>pszMessage</i> =NULL)	Alerts a problematic body phase of the specified step and supplies an optional message.
VOID AlertStepBodyFailure (LPCTSTR <i>pszStep</i> , LPCTSTR <i>pszMessage</i> =NULL)	Alerts a failed body phase of the specified step and supplies an optional message.
VOID AlertStepConfirmationSuccess (LPCTSTR <i>pszStep</i> , LPCTSTR <i>pszMessage</i> =NULL)	Notifies a successful confirmation phase of the specified step and supplies an optional message.
VOID AlertStepConfirmationWarning (LPCTSTR <i>pszStep</i> , LPCTSTR <i>pszMessage</i> =NULL)	Alerts a problematic confirmation phase of the specified step and supplies an optional message.
VOID AlertStepConfirmationFailure (LPCTSTR <i>pszStep</i> , LPCTSTR <i>pszMessage</i> =NULL)	Alerts a failed confirmation phase of the specified step and supplies an optional message.

3.2.2. Specific Step Functions

Function	Description
BOOL SetProcedureState (LPCTSTR <i>pszName</i> , UINT <i>nState</i>)	Sets the execution state of the specified telecommand procedure. The following options are available: TCPROCEDURE_ACTIONSTATE_SUSPEND TCPROCEDURE_ACTIONSTATE_RESUME TCPROCEDURE_ACTIONSTATE_ABORT
BOOL SetThreadState (LPCTSTR <i>pszName</i> , UINT <i>nState</i>)	Sets the execution state of the specified thread. The following options are available: TCPROCEDURETHREAD_ACTIONSTATE_SUSPEND TCPROCEDURETHREAD_ACTIONSTATE_RESUME TCPROCEDURETHREAD_ACTIONSTATE_ENABLE TCPROCEDURETHREAD_ACTIONSTATE_DISABLE TCPROCEDURETHREAD_ACTIONSTATE_ABORT
BOOL CallProcedure (LPCTSTR <i>pszName</i> ,...)	Calls the specified telecommand procedure and waits upon its completion.
BOOL StartProcedure (LPCTSTR <i>pszName</i> ,...)	Starts the specified telecommand procedure and continues its execution.

BOOL SetSynchronizationObject (LPCTSTR <i>pszSyncObject</i>)	Signals the specified synchronization object.														
BOOL WaitSynchronizationObject (LPCTSTR <i>pszSyncObject</i> , DWORD <i>dwTimeout</i>)	Waits for the specified synchronization object to get signaled within the indicated amount of milliseconds.														
BOOL WaitTimeInterval (DWORD <i>dwTimeInterval</i>)	Waits the specified amount of milliseconds.														
BOOL WaitAbsoluteTime (CONST CTimeTag <i>&tTime</i>)	Waits until the specified absolute time.														
BOOL InjectAlert (LPCTSTR <i>pszAlert</i>)	<p>Injects an alert as an event. The supplied string must follow these formatting guidelines:</p> <table border="0"> <thead> <tr> <th>Flag</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>/CATEGORY</td> <td>Specifies the category to which the message belongs: 'System', 'Spacecraft' or 'User'</td> </tr> <tr> <td>/TYPE</td> <td>Specifies the type of the message. Predefined values are: 'Success', 'Informational', 'Warning', 'Error' or 'Scheduled'. Other custom types are also possible.</td> </tr> <tr> <td>/SUBTYPE</td> <td>Specifies the subtype of the message. This flag can be used together with the type to perform filtering.</td> </tr> <tr> <td>/MESSAGE</td> <td>Specifies the message text.</td> </tr> <tr> <td>/COMMENT</td> <td>Specifies any comment associated with the message.</td> </tr> <tr> <td>/AUDITION</td> <td>Specifies the name of an existing audition profile to be used when the message is displayed.</td> </tr> </tbody> </table> <p> Note: This option only works with the 'Global Eventbox'. It is ignored for other Eventbox display windows.</p>	Flag	Description	/CATEGORY	Specifies the category to which the message belongs: 'System', 'Spacecraft' or 'User'	/TYPE	Specifies the type of the message. Predefined values are: 'Success', 'Informational', 'Warning', 'Error' or 'Scheduled'. Other custom types are also possible.	/SUBTYPE	Specifies the subtype of the message. This flag can be used together with the type to perform filtering.	/MESSAGE	Specifies the message text.	/COMMENT	Specifies any comment associated with the message.	/AUDITION	Specifies the name of an existing audition profile to be used when the message is displayed.
Flag	Description														
/CATEGORY	Specifies the category to which the message belongs: 'System', 'Spacecraft' or 'User'														
/TYPE	Specifies the type of the message. Predefined values are: 'Success', 'Informational', 'Warning', 'Error' or 'Scheduled'. Other custom types are also possible.

BINARY SPACE

RELIABLE SPACE SYSTEMS

<i>tExecutionTime</i>	Specifies the time at which the telecommand function should be executed on-board of the spacecraft; otherwise it is 0.
<i>dwExecutionOffset</i>	Specifies the execution time offset with respect to the start of the sequence. If the telecommand function is not part of a sequence it is 0.  Note: This offset must be considered in the absolute execution time already and is used for display purposes only.
<i>nBlockID</i>	Specifies the block identifier (≥ 0) for a blocked telecommand. If the telecommand function is not part of a sequence or if it is not blocked it is -1.
<i>bGrouped</i>	Indicates if the telecommand function is to be grouped with the previous entry in the sequence. It is FALSE if the telecommand function is not part of a sequence.
<i>bCritical</i>	Indicates if the telecommand function needs to be acknowledged before being released.
<i>nAckFlags</i>	Specifies one or more of the options* below when the telecommand function is part of a sequence; otherwise one or more of these options**. The options indicate if the operator should acknowledge a completed verification step.

3.2.3. Thread Functions

Function	Description
BOOL WaitThreadActivationExpression()	Waits until the thread activation expression returns TRUE.  Note: This function returns FALSE whenever the thread execution has been aborted.
VOID EnableThread (BOOL <i>bEnable</i>)	Enables/disables the current thread.
BOOL IsThreadEnabled ()	Returns TRUE if the current thread is enabled.
VOID ResetThread ()	Resets the current thread.

3.3. Satellite Tracking, Pass & Interlink Functions

An extensive interface is provided by the TPL to support satellite tracking, location pass predictions as well as satellite interlink calculations.

Function	Description								
double CalculateSpacecraftOrbitLongitude (LPCTSTR <i>pszSpacecraft</i> , UINT <i>nNORADID</i> , CONST CTimeKey & <i>tTime</i>)	Returns the longitude of the specified spacecraft < <i>pszSpacecraft</i> , <i>nNORADID</i> > at the time <i>tTime</i> . 📌 Note: <ul style="list-style-type: none"> • This function is available for Earth-centric spacecraft only • The parameter <i>tTime</i> must be within an interval of a few days from current real-time in order to guarantee a precise result • The returned longitude will be between 0...360 degrees <table border="1"> <thead> <tr> <th>Argument</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td><i>pszSpacecraft</i></td> <td>The name of spacecraft.</td> </tr> <tr> <td><i>nNORADID</i></td> <td>The NORAD identifier of the specified spacecraft.</td> </tr> <tr> <td><i>tTime</i></td> <td>The time for which the longitude should be calculated.</td> </tr> </tbody> </table>	Argument	Description	<i>pszSpacecraft</i>	The name of spacecraft.	<i>nNORADID</i>	The NORAD identifier of the specified spacecraft.	<i>tTime</i>	The time for which the longitude should be calculated.
Argument	Description								
<i>pszSpacecraft</i>	The name of spacecraft.								
<i>nNORADID</i>	The NORAD identifier of the specified spacecraft.								
<i>tTime</i>	The time for which the longitude should be calculated.								
double CalculateSpacecraftOrbitLatitude (LPCTSTR <i>pszSpacecraft</i> , UINT <i>nNORADID</i> , CONST CTimeKey & <i>tTime</i>)	Returns the latitude of the specified spacecraft < <i>pszSpacecraft</i> , <i>nNORADID</i> > at the time <i>tTime</i> . 📌 Note: <ul style="list-style-type: none"> • This function is available for Earth-centric spacecraft only • The parameter <i>tTime</i> must be within an interval of a few days from current real-time in order to guarantee a precise result • The returned latitude will be between -90...90 degrees <table border="1"> <thead> <tr> <th>Argument</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td><i>pszSpacecraft</i></td> <td>The name of spacecraft.</td> </tr> <tr> <td><i>nNORADID</i></td> <td>The NORAD identifier of the specified spacecraft.</td> </tr> <tr> <td><i>tTime</i></td> <td>The time for which the latitude should be calculated.</td> </tr> </tbody> </table>	Argument	Description	<i>pszSpacecraft</i>	The name of spacecraft.	<i>nNORADID</i>	The NORAD identifier of the specified spacecraft.	<i>tTime</i>	The time for which the latitude should be calculated.
Argument	Description								
<i>pszSpacecraft</i>	The name of spacecraft.								
<i>nNORADID</i>	The NORAD identifier of the specified spacecraft.								
<i>tTime</i>	The time for which the latitude should be calculated.

TIMETAG **CalculateSpacecraftPassStartTime**(

LPCTSTR *pszSpacecraft*, UINT *nNORADID*,
 LPCTSTR *pszLocation*,
 double *fLocationLongitude*,
 double *fLocationLatitude*,
 double *fLocationAltitude*,
 CONST CTimeKey &*tStartTime*,
 CONST CTimeSpan &*tInterval*)

Returns the begin of the next pass over the location $\langle pszLocation, fLocationLongitude, fLocationLatitude, fLocationAltitude \rangle$ of the specified spacecraft $\langle pszSpacecraft, nNORADID \rangle$ after the time *tStartTime* and within the subsequent *tInterval* interval.

Note:

- This function is available for Earth-centric spacecraft only
- The parameter *tStartTime* must be within an interval of a few days from current real-time in order to guarantee a precise result

Argument	Description
<i>pszSpacecraft</i>	The name of spacecraft.
<i>nNORADID</i>	The NORAD identifier of the specified spacecraft.
<i>pszLocation</i>	The name of pass-over location.
<i>fLocationLongitude</i>	The longitude (deg) of the pass-over location.
<i>fLocationLatitude</i>	The latitude (deg) of the pass-over location.
<i>fLocationAltitude</i>	The altitude (km) of the pass-over location.
<i>tStartTime</i>	Specifies the start time to be used to calculate the next pass over the specified location.
<i>tInterval</i>	Specifies the interval to be used to calculate the next pass over the specified location.

Returns the end of the next interlink session between the spacecraft *<pszSpacecraftA,nNORADIDA>* and *<pszSpacecraftB,nNORADIDB>* via the relais *<pszSpacecraftVia,nNORADIDVia>* after the time *tStartTime* and within the subsequent *tInterval* interval.

Note:

- This function is available for Earth-centric spacecraft only
- The parameter *tStartTime* must be within an interval of a few days from current real-time in order to guarantee a precise result

Argument	Description
<i>pszSpacecraftA</i> <i>nNORADIDA</i>	The name of first spacecraft. The NORAD identifier of the first spacecraft.
<i>pszSpacecraftVia</i> <i>nNORADIDVia</i>	The name of relais spacecraft. The NORAD identifier of the relais spacecraft.
<i>pszSpacecraftB</i> <i>nNORADIDB</i>	The name of second spacecraft. The NORAD identifier of the second spacecraft.
<i>tStartTime</i>	Specifies the start time to be used to calculate the next interlink session.
<i>tInterval</i>	Specifies the interval to be used to calculate the next interlink session.

Note:

All satellite tracking, pass & interlink functions cannot be tested within the SatView™ Editor; they all return 'NAN' (for 'double' data types) and '0' (for 'TIMETAG' data types). When executed within the SatView™ Desktop, the satellite tracking sub-system must be enabled for these functions to return valid results. Furthermore, it must be ensured that access to the Internet is guaranteed.

Helper Functions:

Function	Description
UINT ConvertBinaryStringToValue (LPCTSTR <i>pszValue</i>)	Converts a binary encoded string into an unsigned integer.
UINT ConvertOctalStringToValue (LPCTSTR <i>pszValue</i>)	Converts a string representing an octal number into an unsigned integer.
UINT ConvertHexadecimalStringToValue (LPCTSTR <i>pszValue</i>)	Converts a string representing a hexadecimal number into an unsigned integer.
TIMETAG ConvertTimeStringToValue (LPCTSTR <i>pszTime</i>)	Converts a string representing a time into a variable of type TIMETAG.  Note: The string must be formatted as follows: DD/MM/YYYY HH:MM:SS.nnn

Data Types:

Identifier	Description
<i>type-specifier</i>	Depending on the data type of the telemetry parameter P_i it is either an UINT, INT, double or CString.
<i>parameter-tag</i>	Tag of the telemetry parameter P_i .
CSpacecraftPosition	A class representing the position of a spacecraft (relative to the Sun for all non Earth-centric ones). The following member properties are available: double m_x double m_y double m_z
CSpacecraftVelocity	A class representing the velocity of a spacecraft (relative to the Sun for all non Earth-centric ones). The following member properties are available: double m_x double m_y double m_z
CString	A class representing a string. Consult the <i>Microsoft® Foundation Class (MFC)</i> documentation.
CTimeTag TIMETAG	A class representing an absolute time in microseconds since January 1, 1970. Consult the <i>Microsoft® Foundation Class (MFC)</i> documentation (see the 'CTime' class).
